                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  /note-*Organ: brain; Vector: pCMVSPORT 6; 1st strand cDNA was primed with a NotI-oligo(dT) primer. Five prime end enriched, double-stranded cDNA was digested with Not I and cloned into the Not I and Eco RV sites of the pCMVSPORT 6 vector. Library is not normalized, but is the control for the normalized libraries. Library was constructed by life Technologies. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                     Score

The human colon cancer antigens can have cytostatic, cardioactive, muscular; neuroprotective, immunomodulatory, gynaecological, gastrointestinal, vulnerary, nephrotropic, antiinfective and antibacterial activities, and can be used in gene therapy. The colon cancer antigen polynucleotides, proteins and antibodies to the proteins are useful for the prevention, treatment and diagnossis of colon disorders, such as colon cancer. The polynucleotides may be used in disorders, such as colon cancer. The polynucleotides may be used in disorders, such as colon cancer. The polynucleotides may be used in disorders and research, such as for chromosome identification, and as hybridisation probes. The proteins may also be used to prevent diseases such as neural disorders, immune system disorders, muscular disorders, reproductive disorders, jumune gastrointestinal disorders, wounds, renal disorders, infectious diseases, and cardiovascular disorders.                                                                                                                                                                                                    В
                                                                                                                                                                                                                                                 δÃ
                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention relates to an isolated polynucleotide encoding a comparising a portion of an ovarian tumour protein. The comparise comprising a portion of an ovarian tumour protein. The comparise comparising a portion of an ovarian tumour protein. The comparise comparise comparison of an ovarian tumour protein. The collater that expresses the sequences is useful for treating ovarian cancer by comparison the patient. An antigen presenting cell chart expresses the sequences is useful for treating ovarian cancer by comparison to find the patient to inhibit the comparison of cancer. The DNA sequences are useful as probes or primers comparison of a concer in a patient to involve cold hybridisation, to direct expression of a polypeptide in appropriate host cells. Detecting the presence of a cancer in a patient comportion to a protein that binds to the apprix, contacting the content of protein that binds to the apprix, comparing the amount of comportion to a predetermined cut-off value and determining the presence of cancer. Sequences ABK09404-ABK09802 represent PCR primers and cDNA content of the content of
                                                                                                                                                                                                                                                                                                        Matches
                                                                                                                                                                                                                                                                                                                                                       Query Match
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             24-MAY-2000; 2000US-207107P.

           The invention relates to nucleic acids and encoded polypeptides which are cancer associated antigens expressed in patients afflicted with small cell lung cancer. The molecules provided by the invention can be used in the diagnosis, monitoring, research or treatment of conditions characterised by the expression of one or more cancer associated antigens. The polypeptide is used to treat a disorder characterised by expression of a hCAAP, and determine regression, progression or onset of a necoded by a nucleic acid (NA) Group 1 molecule. The disorders are small and non-small cell lung cancer, melanoma, colon, broast, head and non-small cell lung cancer, melanoma, colon, broast, head
                                                                                                                                                                                                                                            Isolated polypeptide, used to treat or prognose a disorder characterized by expression of a hCAAP e.g. cancer, is encoded by an isolated nucleic acid comprising an NA Group 3 or 4 molecule -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Human; small cell lung cancer; therapy; hCAAP; nucleic acid; NA; melanoma; cancer; colon; breast; head; neck; transitional cancer; leimyosarcoma; helix-loop-helix; head; protein-binding factor; MPP11; synovial sarcoma; cytostatic; ds.

The present invention provides the protein and coding sequences of a number of apoptosis associated proteins from the yeast Saccharomyces cerevisiae and the fungus Candida albicans. These can be used to identify treatments for fungal and yeast infections, for proliferative diseases and for apoptosis related diseases such as autoimmune diseases, ischaemia and neurodegeneration. The present sequence is one of the C. albicans
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Yeast and fungal nucleic acids encoding proteins involved in a pathway leading to programmed cell death, useful for treating proliferative disorders, yeast and fungal infections, or for preventing apoptosis in certain diseases -

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present invention provides the protein and coding sequences of a number of apoptosis associated proteins from the yeast Saccharomyces cerevisiae and the fungus Candida albicans. These can be used to identify treatments for fungal and yeast infections, for proliferative diseases and for apoptosis related diseases such as autoimmune diseases, ischaemia and neurodegeneration. The present sequence is one of the S. cerevisiae

This sequence represents the yeast zuotin gene. Fragments of the encoded CC protein can be used as the amphiphilic peptides used in the macroscopic membrane (MM) of the invention. The MM is formed by self-assembly of the containing monovalent metal cations. The MM are stable in serum, are containing monovalent metal cations. The MM are stable in serum, are containing monovalent metal cations. The MM are stable in serum, are containing monovalent metal cations. The MM are stable in serum, are containing monovalent metal cations. The MM are stable in serum, are containing products (e.g. sutures), or internal linings. The MM are useful as slow-diffusion drug delivery vehicles for protein-type drugs, cincluding erythropoietin, tissue-type plasminogen activator, synthetic containing articles (e.g. dialysis membranes). Collagen may be combined with the peptides to produce membranes for use as artificial skin. The MM compared the self assembly of the produce membranes for use as artificial skin. The MM could be useful for treating Alzheimer's disease or scrapie infection. As they are resistant to proteolytic digestion and alkaline and acidic phecomology as the containing and migration. The permeability of the MM could be call adhesion and migration. The permeability of the MM also permits collarers which is made of the MM could be collarers of differentiated cells and/or stratified cell
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Membranes formed by self-assembly of amphiphilic peptide(s) - useful as bio:material(s), separation matrices, drug delivery vehicles,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Example 5; Column 29-34; 49pp; English.

(e.g. for in vivo use as implants). They are particularly useful as

experimental models for Alzheimer's disease and scrapie infection and so

may be used in disease modelling experiments and to assay for agents

which modulate the disease processes. Additionally, they may be used in

this way to study liver cirrhosis, kidney amyloidosis and other protein

conformational diseases. The membrane in the membrane/cell mixture

produced in the method: (i) supports cellular attachment and growth;

(ii) self-assembles to form large, macroscopic membranes that are

insoluble and stable in aqueous solutions, serum and ethanol; (iii) is

highly resistant to heat, alkaline/acidic pHs, chemical denaturants and

proteolytic digestion; (iv) is non-cytotoxic and non-immunogenic; (v) is

constituted by the method of the structures with

simple structures, high tensile strength and a porous structure;

(vii) may be metabolised by humans and animals; (viii) is inexpensive to

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        This sequence encodes the human zuotin (ZUO1) protein. Fragments of the protein can be used in the in vitro method of the invention. The method is for culturing cells utilising stable macroscopic membranes formed by the self-assembly of amphiphilic peptides. The peptides are salt-induced to form insoluble and protease-resistant protein filaments with a beta-sheet secondary structure. The membranes may be may be useful in a wide variety of medical, research, industrial and biomaterial applications such as slow-diffusion drug delivery systems, artificial applications such as slow-diffusion drug delivery systems, artificial skin and separation matrices. The membranes may be used to support in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Cell cultures utilising stable macroscopic membranes formed by the self-assembly of amphiphilic peptides

                                                                                                                                                                                                                                                                                                                                            The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invent: useful in developmental biology and in elucidating cell signalling cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL0130511), expressed DNA sequences (ABL0130737-ABB72072).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              1724 TTCAAGATTATTCAAAAGGCCTTTGAAACTTTGACTGATTC

The invention useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL01840-ABL16175) and the encoded proteins (ABB73737-ABB72072).
                                                                                                                                                                                                                                                                                                                                                                   The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from at ftp.wipo.int/pub/published_pct_sequences.
